# Selection Table for Universal Dimmer Switches, Capacity Enhancer and 1-10 V Controllers 

## The Energy Savers

Set the mood and reduce energy costs at the same time - a fascinating combination for incandescent lamps, halogen lamps and LED lamps. The dimming of lamps in combination with soft ON and soft OFF, prolongs their lifetime considerably. This applies also to the new infinitely dimmable energy saving lamps. Only universal dimmers with the marking $R, L, C$ recognize automatically the connected load and adjust their dimming function accordingly. Other dimmers have to be exchanged if lamps with other kind of loads are used later. Only dimmer switches with additional ESL marking are optimized for dimmable energy saving lamps. Only universal dimmer switches with an additional LED marking are optimized for dimmable LED lamps.

1) Power MOSFET 300 W .
${ }^{\text {2) }}$ Applies to glow lamps with 170 V ignition voltage, for glow lamps with 90 V ignition voltage approx. $1 / 2$ glow lamp current.
${ }^{3)}$ Depends on the set function.
${ }^{4)}$ Will automatically be switched on from 110 V control voltage.
${ }^{5)}$ Same load as main dimmer switch or separate R, L or C load, depending on circuit.
${ }^{6)}$ This specification refers to EUD12Z or EUD12D, which is connected in series.
${ }^{7)}$ This specification refers to the connected EUD12D, EUD12Z or LUD12 depending on the selected mode.

Function rotary switch

Typical connection

## Power MOSFET up to 400W. Energy saving lamps ESL up to 100 W and LED up to 100 W . Standby loss 0.1 watt only. With adjustable minimum or maximum brightness and dimming speed. With switching operation for children's rooms and snooze function.

Modular device for DIN EN 60715 TH35 rail mounting.
1 module $=18 \mathrm{~mm}$ wide, 58 mm deep.
Universal dimmer switch for $R$, $L$ and $C$ loads up to 400 watts, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watts and dimmable 230V LED lamps up to 250 watts. Automatic detection of load $R+L$ or $R+C$. ESL and LED is manually settable. No minimum load required.
Zero passage switching with soft start and soft OFF to protect lamps.
Universal control voltage input $\mathbf{8}$ to $\mathbf{2 3 0}$ V UC, electrically isolated from the 230 V supply voltage and switching voltage.
Short-time control commands switch on/off, permanent control varies the brightness to the maximum level.
An interruption of control changes the direction of dimming.
The setting of the brightness level is stored after switching off.
In case of a power failure the switching position and the brightness level are stored. If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
Glow lamp current up to 5 mA starting at 110 V .
Automatic electronic overload protection and over-temperature switch-off.
The LED below the rotary switch on the front shows control commands. It starts blinking after 15 seconds if a pushbutton is inhibited.
In operation, the top rotary switch determines the load type to which the dimming curve is set.
Position R, L, C is the setting for all load types except for ESL and LED. In particular for 230V glow and halogen lamps. Automatic detection of load type inductive or capacitive.
The settings +ESL and -ESL consider the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. In position -ESL Memory is switched off. This can be of advantage for energy saving lamps because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
The position LEDs take account of special conditions with dimmable 230V LED lamps: A number of different dimming curves are available. An updated list with dimming curve assignment for commercially available dimmable 230V LED lamps is ready for downloading at www.eltako.com/dimming_curve/LED_gb.pdf. In these settings no wound (inductive) transformer must be dimmed.
The minimum brightness level (completely dimmed down) or the maximum brightness level (completely dimmed up) is adjustable with the middle \%:ס्ठ: rotary switch.
The dimming speed can be adjusted with the lower dimming speed rotary switch. The duration of soft start and soft OFF is changed simultaneously.
With special switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function: With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
Mixing of $L$ loads (inductive loads, e.g. wound transformers) and $C$ loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230 V incandescent lamps and halogen lamps) may be added anytime.

Mixing of L loads and C loads is possible with dimmer switches EUD12Z (description page B2) and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

Technical data page B15. Housing for operating instructions GBA12 page Z5.

## Universal Dimmer Switch EUD12Z for central control

Function rotary switches

Standard setting ex factory.
Typical connection

## Power MOSFET up to 400W. Energy saving lamps ESL up to 100 W. Standby loss 0.1 watt only. With adjustable minimum brightness and dimming speed. With switching operation for children's rooms and snooze function.

Modular device for DIN EN 60715 TH35 rail mounting. 1 module $=18 \mathrm{~mm}$ wide, 58 mm deep. Universal dimmer switch for R, L and C loads up to 400W, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watts. Automatic detection of load $\mathrm{R}+\mathrm{L}$ or $\mathrm{R}+\mathrm{C}$. ESL is manually settable.

## Zero passage switching with soft start and soft OFF to protect lamps.

Up to $\mathbf{3 4 0 0} \mathbf{W}$ with capacity enhancers LUD12-230 V (description page B5) at the terminals X1 and X2. Universal voltage control input from 8 to 230 V UC and additionally the universal voltage control inputs 8 to 230 V UC central ON and central OFF. The control inputs are electrically isolated from the 230V supply voltage and switching voltage.
Short-time control commands switch on/off, permanent control varies the brightness to the maximum level. A interruption of control changes the direction of dimming. The setting of the brightness level is stored after switching off. Glow lamp current up to 5 mA starting at 110 V (not for priorities 4 and 8). Automatic electronic overload protection and over-temperature switch-off. The LED below the upper rotary switch on the front indicates a local or central control. During local control it starts blinking after 15 seconds if a pushbutton is inhibited.
With the top rotary switch either the dimming speed is adjustable in five steps or the minimum brightness on energy saving lamps ESL is adjustable in four steps.
The settings +ESL and -ESL consider the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. In position -ESL Memory is switched off. This can be of advantage for energy saving lamps because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
This impulse dimmer switch can be operated completely or partially as central control device.
The middle rotary switch adjusts the central control.
$Z E+Z A=$ central $O N$ and central $O F F, Z E=$ central $O N$ only,
$Z A=$ central OFF only, ZE $Z A=$ no central control
The lower rotary switch sets several priorities. These determine which other control inputs are inhibited as long as onother control input is excited permanently.
Furthermore, here it is decided if the switch position should be kept or not after a power failure: In positions 1 to 4 of the rotary switch the switch position remains unchanged, in positions 5 to 8 it is switched off. Incoming central commands are executed immediately affer the power supply returns.
OFF = Permanent OFF
1 and $\mathbf{5}=$ No priority. Also if central control inputs are excited permanently, it is possible to operate the device by pushing a local pushbutton. The last central command is executed. This is the setting ex works.
2 and $\mathbf{6}$ = Priority for central ON and OFF. Local pushbuttons are temporarily inhibited. However, continuous excitation central OFF has priority over continuous excitation central ON.
3 and 7 = Priority for central ON and OFF. Local pushbuttons are temporarily inhibited. However, continuous excitation central ON has priority over continuous excitation central OFF.
4 and 8 = Priority for permanently excited local pushbutton. In the meantime central commands are not executed. In these positions a glow lamp current is not permitted.
ON = Permanent ON
With special switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level. Snooze function: With a double impulse the lighting is dimmed down from the current dimming position and finally switched off. The current dimming position determines the dimming time (max. = 60 minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
Mixing of L loads (inductive loads, e.g. wound transformers) and C loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230V incandescent lamps and halogen lamps) may be added anytime.
Mixing of L loads and C loads is possible with dimmer switches EUD12Z and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

Technical data page B15. Housing for operating instructions GBA12 page Z 5 .

Typical connections

## Power MOSFET up to 400 W . Energy saving lamps ESL up to 100 W and LED up to 100 W . Standby loss 0.3 watt only. With adjustable minimum brightness, maximum brightness and dimming speed. With switching operation for children's rooms and snooze function.

Modular device for DIN EN 60715 TH35 rail mounting. 1 module $=18 \mathrm{~mm}$ wide, 58 mm deep. Universal dimmer switch for R, L and C loads up to 400 watt, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watt and dimmable 230V LED lamps up to 100W. Automatic detection of load R+L or R+C. ESL and LED is manually settable.
Up to $\mathbf{3 4 0 0}$ W with capacity enhancers LUD12-230 V (description page B5) at the terminals X1 and X2. Universal control voltage 8 to 230 V UC and additionally the universal voltage control inputs 8 to 230 V UC central ON and central OFF. The control inputs are electrically isolated from the supply voltage and switching voltage. Zero passage switching with soft start and soft OFF to protect lamps. In case of a power failure the switching position and the brightness level are stored. If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered. From 110 V control voltage glow lamp current up to 5 mA (not for RTD, ER and TI). Automatic electronic overload protection and over-temperature switch-off. The functions and times are entered using the MODE and SET keys as described in the operating manual and indicated on the LC display. A keylock function is provided.
EUD = Universal dimmer switch with settings for dimming speed, minimum brightness, maximum brightness, memory and Soft ON/OFF as well as choice of priority for central control same like EUDI2Z-UC. ESL and LED is settable. Short-time control commands switch on/off, permanent control varies the brightness to the maximum level. A interruption of control changes the direction of dimming.
The setting ESL considers the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. It may be beneficial to switch off the memory on the ESL, because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
The settings LED take account of special conditions with dimmable 230V LED lamps: A number of different dimming curves are available. An updated list with dimming curve assignment for commercially available dimmable 230V LED lamps is ready for downloading at www.eltako.com/dimming_curve/LED_gb.pdf. In these settings no wound (inductive) transformer must be dimmed.
Switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function: With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
RTD = Same as universal dimmer switch EUD but also comprising activation via two direction switches on the universal voltage control inputs 8..230V UC.
ESV = Same as universal dimmer switch EUD but also comprising setting for a time delay from 1 to 99 minutes. Switch-off early warning at the end by dimming is selectable and adjustable from 1 to 3 minutes.

TLZ = Staircase time switch with switchable switch-off early warning by dimming. With pump and permanent light by pushbutton. Time adjustable from 1 to 99 minutes. Switch-off early warning (no flickering) by dimming is adjustable from 1 to 3 minutes. Also for dimmable energy saving lamps ESL and 230V LED lamps. MIN = Universal dimmer switch, switches when control voltage is applied to the minimum brightness setting. Maximum brightness is dimmed during the set dim time from 1 to 99 minutes. When the control voltage is interrupted, the device is switched off immediately, even during the dim time. MMX = Same function as for MIN; when the control voltage is interrupted, dimming still continues until the set minimum brightness is reached. Then the device is switched off. $\mathbf{T I}=$ Clock with adjustable switch on/off times from 0.1 to 9.9 seconds. The maximum brightness is adjustable from 3 to $99 \%$. $\mathbf{E R}=$ Switching relay with setting for Soft ON/OFF from 0.1 to 9.9 seconds. The maximum brightness is adjustable from 3 to $99 \%$. $\mathbf{O N}=$ permanent $O N$. $\mathbf{O F F}=$ permanent OFF.
The dim position in \% or the time lapse in minutes is indicated in the middle of the display. The expired, resettable switch-on time is indicated at the bottom of the display. Display menu guidance including language selection (German, English, French, Italian or Spanish) is described in the supplied operating manual. Also available online at www.eltako-ba.de.
Technical data page B15. Housing for operating instructions GBA12 page Z5.

Standard setting ex factory.

Typical connection

## Power MOSFET up to 300 W. Energy saving lamps ESL up to 100 W. Standby loss 0.1 watt only. With adjustable minimum brightness and dimming speed. With switching operation for children's rooms and snooze function.

Modular device for DIN EN 60715 TH35 rail mounting.
1 module $=18 \mathrm{~mm}$ wide, 58 mm deep.
Universal dimmer switch for R, L and C loads up to 300 watt, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watt. Automatic detection of load $R+L$ or $R+C$. ESL is manually settable.
Zero passage switching with soft start and soft OFF to protect lamps.
Supply voltage and switching voltage 230V.
Short-time control commands switch on/off, permanent control varies the brightness to the maximum level.
An interruption of control changes the direction of dimming.
The setting of the brightness level is stored after switching off.
In case of a power failure the switching position and the brightness level are stored. If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
Automatic electronic overload protection and over-temperature switch-off.
With integrated switching-off relay for the mains disconnection of switched circuits.
The control pushbutton(s) of the room are connected via low voltage control wires to the terminals T 1 and T2 of the EUD12F (field-free internal DC voltage). The permanent power supply must be connected directly to a phase conductor ahead of the mains disconnection relay FR12-230V. Due to this, the complete function remains but the leads to the lamps is disconnected by means of the switching-off relay. A glow lamp current is not permitted.
The minimum brightness level (completely dimmed down) can be adjusted with the upper rotary switch \%:\%্\%:, e.g. for dimmable energy saving lamps.
The dimming speed can be adjusted with the lower dimming speed rotary switch. Simultaneously the soft on and soft off period is changed.
The settings +ESL and -ESL consider the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. In position -ESL Memory is switched off. This can be of advantage for energy saving lamps because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
With special switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function: With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
Mixing of $L$ loads (inductive loads, e.g. wound transformers) and $C$ loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230V incandescent lamps and halogen lamps) may be added anytime.

Mixing of L loads and C loads is possible with dimmer switches EUD12Z (description page B2) and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

Technical data page B15. Housing for operating instructions GBA12 page Z5.

## LUD12-230V

Function rotary switch

Standard setting ex factory.
The switching mode "one lamp"(:סְ:) or "additional lamps" (:8:\% on the front.

This setting must be same as the actual installation, otherwise there is a risk of destruction of the electronics.

For different setting on ESL and 230V LED lamps, see page B6.

Technical data page B15.
Housing for operating instructions GBAl2 page Z5.

## R, L, C, ESL $\quad$ 击 $\min (1)$

Power MOSFET up to 400 W, ESL up to 100 W and 230 V LED up to 100 W . Standby loss 0.1 watt only.

Modular device for DIN EN 60715 TH35 rail mounting.
1 module $=18 \mathrm{~mm}$ wide, 58 mm deep.
Capacity enhancers LUD12-230V can be connected to the universal dimmer switches EUD12Z, EUD12D, SUD12 (1-10V) input and FUD12/800W. By this the switching capacity for one lamp will be increased according to the below mentioned table depending on ventilation conditions up to 400, 350 or 400W or alternatively for additional lamps up to 500W per each capacity enhancer.
Both switching modes for increase of capacity can be executed simultaneously.
Automatic detection of load R+L or R+C in the circuit "Increase of capacity with additional lamps". Supply voltage 230V.
Automatic electronic overload protection and over-temperature switch-off.
In the mode "Increase of capacity with additional lamps" the kind of load of a capacity enhancer LUD12-230 V can vary from the kind of load of the universal impulse dimmer switch.
Therefore it is possible to mix L loads and C loads.
Increase of capacity for one lamp (ẹ: ), ESL and LED see next page

Increase of capacity with additional lamps (:סְ:ৃ:\%:), ESL and LED see next page

EUD12Z, EUD12D and SUD12:
1.-6. LUD12 + 400W each 8. LUD12 + 200W

## FUD12/800 W:

1.-6. LUD12 + 400W each
7. LUD12 + 200 W each

For the SUD12 and the
FUDI2/800W see the different connection example as per the operating instructions.

## Capacity Enhancer LUD12 for Universal Dimmer Switches

## Increase of capacity for dimmable energy saving lamps ESL and dimmable 230V LED lamps

Function rotary switch

This setting must be made on the front panel on ESL and 230V LED lamps. Also with power increase with additional lamps.
Otherwise there is a risk of destruction of the electronics.

Increase of capacity for one lamp (e: )

Increase of capacity with additional lamps (:סְ: \%i:

1.-9. LUD12 + 100W each

For the FUD12/800W see the different connection example as per the operating instructions.

Technical data page B15. Housing for operating instructions GBA12 page $\mathrm{Z5}$.
$\square$

Typical connections

## Power MOSFET up to 300 W. Standby loss 0.3 watt only. Minimal speed, maximum speed and dimming speed are adjustable.

Modular device for DIN EN 60715 TH35 rail mounting. 1 module $=18 \mathrm{~mm}$ wide, 58 mm deep.
Motor dimmer with phase control for L loads up to 300W, depending on ventilation conditions. Only 1 motor may be connected.
Universal control voltage 8 to 230 V UC and additionally the universal voltage control inputs 8 to 230V UC central ON and central OFF. The control inputs are electrically isolated from the supply voltage and switching voltage.

## Switching in zero crossing and switch-on at increased speed.

If there is a power failure, the switch position and the speed level are saved. The device can be switched on when the power supply is restored.
Automatic electronic overload protection and over-temperature switch-off.
Enter the 6 functions and times using the MODE and SET keys as described in the operator manual. The functions and times are indicated in the LC display. Other features include language selection and keylock.
The total switch-on time is added and indicated in the bottom line of the display. It can be reset to zero.
The top line shows the parameters during the setting procedure and the active function in service. The left arrow indicates the switch position 'ON' and the right arrow shows the keylock function when applied. During the setting procedure, the middle line shows the parameters set. In service, the middle line indicates the speed between 10 and 99 for the MOD and DSD functions or the remaining time in minutes for the Udo and ODT functions.
MOD = Motor dimmer with settings for dimming speed DSP, minimum speed MI\%, maximum speed MA\%, memory function MEM+ and selection of the central control inputs ON and/or OFF when activated or deactivated. Short commands switch on/off, permanent activation changes speed. An interruption in activation changes the dimming direction.
DSD $=$ Motor dimmer with activation with two direction buttons for dimming direction. Setting the dimming speed DSP, minimum speed MI\%, maximum speed MA\% and memory function MEM+. When activation takes place via +El , a short command switches on. Permanent activation dims up to maximum speed. A double-click immediately dims to maximum speed. When activation takes place via + Fl, a short command switches off. Permanent activation dims down to minimum speed. No central control function.

Udo = Motor dimmer as for MOD function with manual on/off. In addition, a time delay time TIM can be set from 1 to 99 minutes. When the time delay expires, the device switches off. Central ON has priority over Central OFF.
ODT = Motor dimmer with run-on switch function with adjustable speed SP\%, response lag AV adjustable from 1 to 99 minutes and time delay RV adjustable from 1 to 99 minutes. When the control voltage is applied, the device switches on after the AV time expires. When the control voltage cuts off, the RV time begins. When the RV time expires, the device switches off. No central control function.
$\mathbf{O N}=$ Permanent ON at maximum speed, OFF = Permanent OFF.
Press MODE and SET briefly and simultaneously to activate the keylock. Then press SET to confirm the flashing LCK. Press MODE and SET simultaneously for 2 seconds to deactivate keylock. Then press SET to confirm the flashing UNL.

August 2011.

Standard setting ex factory.

Typical connection

## 1 NO contact not potential free 600 VA and $1-10 \mathrm{~V}$ control output 40 mA . Only 1 watt standby loss. With adjustable minimum brightness and dimming speed. With switching operation for children's rooms and snooze function.

Modular device for DIN-EN 60715 TH35 rail mounting. 1 modul $=18 \mathrm{~mm}$ wide, 58 mm deep.
Zero passage switching with soft ON and soft OFF to protect lamps.
Universal control voltage 8 to 230 V UC, local and central on/off with same potential. Supply voltage 230 V electrically isolated.
State-of-the-art hybrid technology combines advantages of nonwearing electronic control with high capacity of special relays.
The brightness level is stored on switch-off (memory).
In case of a power failure the switch position and the brightness stage are stored and may be switched on when the power supply is restored.
The minimum brightness (fully dimmed) is adjustable with the upper \%:ర్?: rotary switch. At the same time, you define whether the children's room function and the snooze function are active (+KI +SL).
The dimming speed is adjustable using the lower dimming speed rotary switch.
The load is switched on and off by a bistable relay at output EVG (electronic ballast units).
Switching capacity for fluorescent lamps or LV halogen lamps with electronic ballast units 600VA.
By using a bistable relay coil power loss and heating is avoided even in the on mode. After installation, wait for short automatic synchronisation before the switched consumer is connected to the mains.
Either direction switches can be connected to $\boldsymbol{\Delta} \boldsymbol{\nabla}$ or these terminals are bridged and a
pushbutton is connected as universal switch.
As direction switch $\mathbf{\Delta}$ is "switch on and $\operatorname{dim}$ up" and $\boldsymbol{\nabla}$ is "switch off and dim down". A double click at $\mathbf{\Delta}$ triggers the automatic updimming until full brightness with dim speed. A double click at $\boldsymbol{\nabla}$ triggers the snooze function. The children's room function is realized with the pushbutton at $\boldsymbol{\Delta}$
As a universal switch, change the direction by briefly releasing the pushbutton.
Switching operation for children's rooms KI (universal switch or direction switch $\mathbf{4}$ ): If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function SL (universal switch or direction switch $\boldsymbol{\nabla}$ ): With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. = 60 minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.

Standard setting ex factory.

Typical connection

Control by pushbutton switches or light switches.

## Without N connection, POWER MOSFET up to 400 W . Standby loss 0.5 watt only. With control inputs for pushbutton light switches and light switches. With adjustable minimum brightness and dimming speed.

Built-in device for installation. 45 mm long, 55 mm wide, 18 mm deep.
Universal dimmer switch for R, L and C loads up to 400 watt, depending on ventilation conditions. Automatic detection of load $\mathrm{R}+\mathrm{L}$ or $\mathrm{R}+\mathrm{C}$.
Energy saving lamps ESL and 230V LED lamps cannot be controlled by the dimmer type EUD61NP-230V (without N-connection).
Zero passage switching with soft start and soft OFF to protect lamps.
Control voltage 230 V . Min. load 40 W .
Short-time control commands switch on/off, permanent control varies the brightness up to the maximum level. A short interruption of control changes the direction of dimming.
The brightness level is stored after switching off.
In case of a power failure the switching position and the brightness level are stored. If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
Automatic electronic overload protection and over-temperature switch-off.
The minimum brightness level (completely dimmed down) can be adjusted with the upper rotary switch \%:ס্̣:.
The dimming speed can be adjusted with the lower dimming speed rotary switch. Simultaneously the soft on and soft off period is changed.
If light switches cannot be replaced by pushbutton light switches, there is a separate control input for light switches. If the switch is opened briefly after closing, the light is dimmed until the next time it is opened again briefly. The dimming direction changes automatically at both peaks. The dimming direction can also be changed by opening the switch briefly twice.
Switching operation for children's rooms (only if controlled by pushbutton light switch): If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function (only if controlled by pushbutton light switch): With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.

## Without N connection, therefore suitable for mounting directly behind the pushbutton light switch or light switch, even if no N wire is available.

Mixing of L loads (inductive loads, e.g. wound transformers) and C loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230 V incandescent lamps and halogen lamps) may be added anytime.

Mixing of L loads and C loads is possible with dimmer switches EUD12Z (description page B2) and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

Standard setting ex factory.

Typical connection

## Power MOSFET up to 400 W. Energy saving lamps ESL up to 100 W and LED up to 100 W . Standby loss 0.1 watt only. With adjustable minimum brightness or dimming speed. With switching operation for children's rooms and snooze function.

For installation. 45 mm long, 55 mm wide, 18 mm deep.
Universal dimmer switch for R, L and C loads up to 400 watts, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watts and dimmable 230V LED lamps up to 250 watts. Automatic detection of load $R+L$ or $R+C$. ESL and LED is manually settable. No minimum load required.

## Zero passage switching with soft start and soft OFF to protect lamps.

Universal control voltage 8 to $\mathbf{2 3 0 V}$ UC, electrically isolated from the 230V supply voltage and switching voltage.
Short-time control commands switch on/off, permanent control varies the brightness up to the maximum level.
An interruption of control changes the direction of dimming.
The brightness level is stored after switching off.
In case of a power failure the switching position and the brightness level are stored.
If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
Automatic electronic overload protection and over-temperature switch-off.
With the top rotary switch \%:סְ̣://dim speed can be adjusted either the minimum brightness level (completely dimmed down) or the dim speed.
In operation, the lower rotary switch determines the load type to which the dimming curve is set. Position R, L, C is the setting for all load types except for ESL and LED. In particular for 230V glow and halogen lamps. Automatic detection of load type inductive or capacitive.
The settings +ESL and -ESL consider the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. In position -ESL Memory is switched off. This can be of advantage for energy saving lamps because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
The position LEDs take account of special conditions with dimmable 230V LED lamps: A number of different dimming curves are available. An updated list with dimming curve assignment for commercially available dimmable 230V LED lamps is ready for downloading at www.eltako.com/dimming_curve/LED_gb.pdf. In these settings no wound (inductive) transformer must be dimmed.
Switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function: With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function. Mixing of L loads (inductive loads, e.g. wound transformers) and C loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230 V incandescent lamps and halogen lamps) may be added anytime.

Mixing of L loads and C loads is possible with dimmer switches EUD12Z (description page B2) and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

## Power MOSFET up to 400 W . Energy saving lamps ESL up to 100 W . Standby loss 0.1 watt only. With adjustable minimum brightness. With switching operation for children's rooms and snooze function.

Built-in device for installation. 45 mm long, 55 mm wide, 18 mm deep.
Universal dimmer switch for R, L and C loads up to 400 watt, depending on ventilation conditions. Dimmable energy saving lamps ESL up to 100 watt. Automatic detection of load $R+L$ or $R+C$. ESL is manually settable.

## Zero passage switching with soft start and soft OFF to protect lamps.

Universal control voltage input $\mathbf{8}$ to $\mathbf{2 3 0}$ V UC, electrically isolated from the 230V supply voltage and switching voltage.
Short-time control commands switch on/off, permanent control varies the brightness to the maximum level.

A interruption of control changes the direction of dimming.
The brightness level is stored after switching off in case the function memory is set.
If the function on max is set, it always switches on at the maximum brightness level.
In case of a power failure the switching position and the brightness level are stored. If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
Automatic electronic overload protection and over-temperature switch-off.
The minimum brightness level (completely dimmed down) can be adjusted with the upper rotary switch \%:\%़\%, e.g. for dimmable energy saving lamps.
The lower function rotary switch selects 7 different functions.
Setting of function ESV same as "memory+soft on" with setting of a release delay up to 90 minutes with the rotary switch \%:": if the manual off command is not given. Before timeout switch-off early warning function by dimming down within 1 minute.
The settings +ESL and -ESL consider the special conditions regarding dimmable energy saving lamps: The starting operation is optimized and adapted to the dimming curve. In these settings the special switching operation for children's rooms is not possible and no wound (inductive) transformer must be dimmed. In position -ESL Memory is switched off. This can be of advantage for energy saving lamps because cold energy saving lamps require a higher minimum brightness as it will possibly be stored in Memory for warmer energy saving lamps.
Switching operation for children's rooms: If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function: With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
Mixing of L loads (inductive loads, e.g. wound transformers) and C loads (capacitive loads, e.g. electronic transformers) is not permitted. R loads (ohmic loads, e.g. 230V incandescent lamps and halogen lamps) may be added anytime.

Mixing of L loads and C loads is possible with dimmer switches EUD12Z (description page B2) and EUD12D (page B3) in connection with capacity enhancer LUD12 (page B5).

Technical data page B15. Housing for operating instructions GBA12 page Z5.

## EUD61M-UC

## NEW

ELD61/12-36V DC $\square$

Power MOSFET for LED Iamps 12-36V DC up to 4A, pulse width modulation PWM. Stand-by loss 0.1 Watt only. With adjustable minimum brightness or dimming speed. With switching operation for children's rooms and snooze function.

For installation. 45 mm long, 55 mm wide, 18 mm deep.
Dimmer switch for R- and LED loads up to 4A depending on ventilation conditions.

## Zero passage switching with soft start and soft OFF to protect lamps.

Control voltage input 12 to 36 V DC, depending on the connected LED illumination. A pulse resistant switching power supply unit is necessary.
Universal control voltage 8..230V UC, electrically isolated from the supply voltage.
Either direction pushbuttons can be connected to $\boldsymbol{\Delta} \boldsymbol{\nabla}$ or these terminals will be bridged and a pushbutton will be connected as an universal pushbutton.
With universal pushbutton: short commands switch on/off, permanent control changes the brightness to the maximum. An interruption of the control changes the dimming direction.
With direction pushbutton: switching and dimming on with $\mathbf{\Delta}$, turning and dimming off with A dual pulse with $\boldsymbol{\Delta}$ effects dimming on up to the maximum brightness with the set dimming speed (dimspeed).
The set brightness level will be stored when furning off (Memory).
In case of power failure the switching position and the brightness level will be stored and will be switched on when supply voltage recurs.
Automatic electronic overload protection and overtemperature switch off.
With the top rotary switch \% : dimmed down) or the dim speed can be adjusted.
The lower rotary switch determines the load type to which the dimming curve is set: position 1 is the standard setting. With position 2 and 3 it can be varied on request.
With switching operation for children's rooms (universal or direction pushbutton $\mathbf{\Delta}$ ):
if the light is switched on by holding down the pushbutton it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is pressed without modifying the latest stored brightness level.
Snooze function (universal or direction pushbutton $\boldsymbol{\nabla}$ ): with a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.

## 1 NO contact not potential free 600 VA and $1-10 \mathrm{~V}$ control output 40 mA . Only 1 watt standby loss. With adjustable dimming speed. With switching operation for children's rooms and snooze function. With pushbutton or switch activation.

Built-in device for installation. 45 mm long, 55 mm wide, 33 mm deep.

Function rotary switches

Standard setting ex factory.

Typical connection

## Zero passage switching with soft ON and soft OFF to protect lamps.

Switching voltage and control voltage 230V.
State-of-the-art hybrid technology combines advantages of nonwearing electronic control with high capacity of special relays.
The load is switched on and off by a bistable relay at output EVG (electronic ballast units). Switching capacity for fluorescent lamps or LV halogen lamps with electronic ballast units 600VA.

## By using a bistable relay coil power loss and heating is avoided even in the on mode.

After installation, wait for short automatic synchronisation before the switched consumer is connected to the mains.
Short-time control commands switch on/off, permanent control varies the brightness up to the maximum level. An interruption of control changes the direction of dimming.
The brightness level is stored after switching off.
In case of a power failure the switching position and the brightness level are stored.
If applicable the dimmer will be switched on at the stored brightness level after the supply voltage is recovered.
The dimming speed is adjustable using the dimming speed rotary switch (only for pushbutton activation).
If light switches cannot be replaced by light pushbuttons, the rotary switch can be set to the switch symbol at the right stop: When the closed switch is briefly opened, the light is dimmed until the switch is briefly opened again. The dimming direction is changed automatically at each of the two vertices. In addition the direction can be changed by opening the switch briefly twice.
Switching operation for children's rooms (only for pushbutton activation): If the light is switched on by holding down the pushbutton, it starts at the lowest brightness level after approx. 1 second and dims up slowly as long as the pushbutton is held down without modifying the last stored brightness level.
Snooze function (only for pushbutton activation): With a double impulse the lighting is dimmed down from the current dimming position to the minimum brightness level and switched off. The current dimming position as well as the adjustable minimum brightness level determine the dimming time (max. $=60$ minutes) which can be reduced as required. It can be switched off at any time by short-time control commands during the lighting is dimmed down. Holding down the pushbutton during the dimming down process dims up and stops the snooze function.
$\left.\begin{array}{|l|l|l|l|l|l|l|l|}\hline & \text { ELD61 } & \begin{array}{l}\text { EUD12NPN } \\ \text { EUD12Z }\end{array} & \begin{array}{l}\text { EUD61 NPN }{ }^{1)} \\ \text { EUD61M }\end{array} \\ \text { EUD12D }\end{array}\right)$

* EVG = electronic ballast units; KVG = conventional ballast units
${ }^{1)}$ At a load of more than 200W (EUD12F: 100W) a ventilation clearance of $1 / 2$ module to adjacent devices must be maintained.
The switching capacity of the EUD61 depends also on the ventilation conditions.
${ }^{2)}$ ) Per dimmer or capacity enhancer it is only allowed to use max. 2 inductive (wound) transformers of the same type, furthermore no-load operation on the secondary part is not permitted. The dimmer might be destroyed. Therefore do not permit load breaking on the secondary part. Operation in parallel of inductive (wound) and capacative (electronic) transformers is not permitted!
${ }^{3)}$ When calculating the load a loss of $20 \%$ for inductive (wound) transformers and a loss of $5 \%$ for capacitive (electronic) fransformers must be considered in addition to the lamp load.
${ }^{4)}$ Affects the max. switching capacity.
${ }^{5)}$ In the settings ESL and LED no wound (inductive) transformer must be dimmed.
${ }^{6)}$ Increase of capacity for dimmable energy saving lamps ESL and dimmable 230V LED lamps see page B6.
${ }^{7)}$ Only 1 motor may be connected.
${ }^{8)}$ For 12 V halogen and LED lamps.
